21 demos, 2 tournaments: did m0NESY's mouse switch help his reaction time?

Discussion | Esports

Found interview where m0NESY said he switched mouse to Logitech PRO X2 SUPERSTRIKE

Wanted to see if 30ms click latency drop actually matters. I had a way to test it without theorycrafting: m0NESY switched mice between IEM Rio and PGL Astana. Same player, same surface, ~6 weeks apart. Natural experiment.

I parsed 21 demos (11 IEM Rio + 10 PGL Astana) and split his reaction into two phases per duel:
- **T0→T1**: enemy becomes visible → m0NESY starts moving crosshair toward enemy. Pure perception/reaction.
- **T1→T2**: starts moving crosshair → first registered hit. Mechanical aim + click.

A click-latency improvement should propagate to T1→T2 (faster click → faster registered hit), NOT T0→T1 (your eyes don't get faster from a better mouse).

Results (median, m0NESY only, peek scenarios including moving enemies up to 300):

IEM Rio (before, N=73)	PGL Astana (after, N=38)	Δ
T0→T1 (reaction)	203 ms	203 ms
T1→T2 (mechanic)	344 ms	211 ms
T0→T2 (total)	547 ms	398 ms

Reaction phase didn't move. Mechanic phase dropped 133ms.

Caveats:
- 133ms is way bigger than the 30ms click latency improvement alone. Most of the drop = 6 weeks of practice + roster context. Can't isolate the mouse.
- Astana mean T1→T2 is 397ms vs median 211ms — long outlier tail (likely re-aim scenarios). Median is the honest number.
- N=38 Astana is below the ≥30 stationary-only threshold I'd want for a confident point estimate.
- With stricter filter (only stationary enemies, ≤120) N drops to 15 and the signal flips. Threshold choice matters here.

Method BVH + AABB ray casting against enemy hitbox for T0 (the `m_bSpotted` flag is broken in CS2 GOTV — don't trust it). Viewangle delta for T1. `player_hurt` event for T2. 64-tick demos, ~15.6ms granularity.

Honest takeaway I can't prove SUPERSTRIKE caused the drop. What I can say is the drop is in the phase where hardware would propagate. T0→T1 staying at 203ms is the structurally interesting part — rules out "feels snappier → plays better" placebo bleeding into reaction.

Analyzed with my own tool which I was building for a year and trying to get users into.

DM if you want your own split.

the most interesting part is the 200ms reaction time, which goes against the "inhuman reactions" narrative

what I found out after analyzing +1000 of duels through my tool, is that most of successful players (money, donk, etc) not just at elite level of reacting and mechanical speed. They're also the best at crosshair pre aim and have insane hit rate of first 5-10 bullets => higher kill rate

5 years coin
That checks out with, say professional baseball & cricket players. What separates the professionals in those sports aren't the reaction times, which are certainly above average, but the ability to guess what kind of pitch will come next and elite bat-to-ball skills.

133 ms is complete insanity. There's probably a data quality issue because that is closer to the gap between a nova and a pro than something possible with a hardware change.

133ms is delta, not his actual mechanic execution. but there is also difference in "n". In Rio I got 73 duels, from Astana for now - 38. When Astana finishes, I'll rerun and see how it changes

Do more players, maybe its just moneys playing better. If the results are better for most of them I buy this mouse tonight.

Glad-Judgment-8395 OP • 15h ago
I have 16 players in my dataset rn, if would be relevant, can post a comparative analysis

*when tried to showcase a tool and accidentally advertised new logitech mouse

I have one and it feels really good. Probably won't be playing fps on anything else - I love the super light trigger setting

Where are you getting the 30ms number from? If I understand the new mouse technology correctly, it essentially just reduces the activation distance for the click. That would indeed (potentially) improve reaction times, but what's the 30ms number based.

If it's a reduction in finger travel time, then it would seem like that would be dependent on the individual using the mouse.

Also I feel like this post should at least mention which mouse model he was using for IEM Rio, if your entire point is a comparison between two mice.

Overall I think this post would benefit a lot from a more extensive explanation on why this mouse may be significant, and where the improvement may come from.

(Admittedly I'm not convinced by the 133ms number, that seems completely unreasonable to me. But I'll reserve actual judgement on that till I see some more info on this)

about 30ms: "HAPTIC INDUCTIVE TRIGGER SYSTEM (HITS)

Milliseconds matter when the win is on the line. Our breakthrough HITS technology replaces the traditional microswitches found in other gaming mice, cutting click latency by up to 30 ms for phenomenally faster targeting." from https://www.logitechg.com/en-us/shop/p/pro-x2-superstrike-mouse

about 133ms I agree and replied to another user here: "
133ms is delta, not his actual mechanic execution. but there is also difference in "n". In Rio I got 73 duels, from Astana for now - 38. When Astana finishes, I'll rerun and see how it changes"

about which mouse he was using for Rio - honestly dunno and for now can't find this info

Forze
Interesting how it seems like he sets the mouse up to not have any of the benefits it's supposed to offer with the trigger settings, he uses all of them so it's like any other mouse it seems.

In 5 years time nobody will be able to string together posts like these without AI assistance.

Or maybe that's now.

de_overpass
Is that a problem? I would rather people doing these kinds of things with AI rather than being lovers with it.
